1. \((-1, 3)\)

2. \[3(-2)^2 - 5(-2) + \frac{1}{(-2)} = 3(4) - 5(-2) - \frac{1}{2}\]

3. We must not allow the denominator to be 0.
   \[x + 4 \neq 0 \Rightarrow x \neq -4\]; Domain: \(\{x | x \neq -4\}\).

4. \[3 - 2x > 5\]
   \[-2x > 2\]

31. Graph \( y = 2x^2 - 3x + 4 \). The graph passes the vertical line test. Thus, the equation represents a function.

32. Graph \( y = x^3 \). The graph passes the vertical line test. Thus, the equation represents a function.

33. Graph \( y = \frac{1}{x} \). The graph passes the vertical line test. Thus, the equation represents a function.

34. Graph \( y = |x| \). The graph passes the vertical line test. Thus, the equation represents a function.

35. \( y^2 = 4 - x^2 \)  
   Solve for \( y \): \( y = \pm \sqrt{4 - x^2} \)  
   For \( x = 0 \), \( y = \pm 2 \). Thus, \((0, 2)\) and \((0, -2)\) are on the graph. This is not a function, since a distinct \(x\)-value corresponds to two different \(y\)-values.

36. \( y = \pm \sqrt{1 - 2x} \)  
   For \( x = 0 \), \( y = \pm 1 \). Thus, \((0, 1)\) and \((0, -1)\) are on the graph. This is not a function, since a distinct \(x\)-value corresponds to two different \(y\)-values.

37. \( x = y^2 \)  
   Solve for \( y \): \( y = \pm \sqrt{x} \)  
   For \( x = 1 \), \( y = \pm 1 \). Thus, \((1, 1)\) and \((1, -1)\) are on the graph. This is not a function, since a distinct \(x\)-value corresponds to two different \(y\)-values.

38. \( x + y^2 = 1 \)  
   Solve for \( y \): \( y = \pm \sqrt{1 - x} \)  
   For \( x = 0 \), \( y = \pm 1 \). Thus, \((0, 1)\) and \((0, -1)\) are on the graph. This is not a function, since a distinct \(x\)-value corresponds to two different \(y\)-values.

39. Graph \( y = x^2 \). The graph passes the vertical line test. Thus, the equation represents a function.

40. Graph \( y = \frac{3x - 1}{x + 2} \). The graph passes the vertical line test. Thus, the equation represents a function.

41. \( 2x^2 + 3y^2 = 1 \)  
   Solve for \( y \): \( 2x^2 + 3y^2 = 1 \)  
   \( 3y^2 = 1 - 2x^2 \)  
   \( y^2 = \frac{1 - 2x^2}{3} \)  
   \( y = \pm \sqrt{\frac{1 - 2x^2}{3}} \)  
   For \( x = 0 \), \( y = \pm \frac{1}{\sqrt{3}} \). Thus, \(\left(0, \frac{1}{\sqrt{3}}\right)\) and \(\left(0, -\frac{1}{\sqrt{3}}\right)\) are on the graph. This is not a function, since a distinct \(x\)-value corresponds to two different \(y\)-values.
Chapter 2: Functions and Their Graphs

42. \( x^2 - 4y^2 = 1 \)

Solve for \( y \):
\[
2\left(\frac{x^2}{4} - y^2\right) = 1
\]
\[
y^2 = \frac{x^2 - 1}{4}
\]
\[
y = \pm\frac{\sqrt{x^2 - 1}}{2}
\]

For \( x = \sqrt{2} \), \( y = \pm\frac{1}{2} \). Thus, \( \left(\sqrt{2}, \frac{1}{2}\right) \) and \( \left(\sqrt{2}, -\frac{1}{2}\right) \) are on the graph. This is not a function, since a distinct \( x \)-value corresponds to two different \( y \)-values.

106. \( A(x) = 4x\sqrt{1-x^2} \)

a. \( A\left(\frac{1}{3}\right) = 4 \cdot \frac{1}{3} \sqrt{1 - \left(\frac{1}{3}\right)^2} = \frac{4}{3} \sqrt{\frac{8}{9}} = \frac{4}{3} \cdot \frac{2\sqrt{2}}{3} \)
   \[= \frac{8\sqrt{2}}{9} = 1.26 \text{ ft}^2 \]

b. \( A\left(\frac{1}{2}\right) = 4 \cdot \frac{1}{2} \sqrt{1 - \left(\frac{1}{2}\right)^2} = \frac{4}{2} \sqrt{\frac{3}{4}} = 2 \cdot \frac{\sqrt{3}}{2} \)
   \[= \sqrt{3} = 1.73 \text{ ft}^2 \]

c. \( A\left(\frac{2}{3}\right) = 4 \cdot \frac{2}{3} \sqrt{1 - \left(\frac{2}{3}\right)^2} = \frac{8}{3} \sqrt{\frac{5}{9}} = \frac{8\sqrt{5}}{3} \)
   \[= \frac{8\sqrt{5}}{9} = 1.99 \text{ ft}^2 \]

107. \( R(x) = \left(\frac{L}{P}\right)(x) = \frac{L(x)}{P(x)} \)

108. \( T(x) = (V + P)(x) = V(x) + P(x) \)

109. \( H(x) = (P \cdot I)(x) = P(x) \cdot I(x) \)

110. \( N(x) = (I - T)(x) = I(x) - T(x) \)

111. a. \( P(x) = R(x) - C(x) \)
   \[= (-1.2x^2 + 220x) - (0.05x^3 - 2x^2 + 65x + 500) \]
   \[= -1.2x^2 + 220x - 0.05x^3 + 2x^2 - 65x - 500 \]
   \[= -0.05x^3 + 0.8x^2 + 155x - 500 \]

b. \( P(15) = -0.05(15)^3 + 0.8(15)^2 + 155(15) - 500 \)
   \[= -168.75 + 180 + 2325 - 500 \]
   \[= 1836.25 \]

c. When 15 hundred cell phones are sold, the profit is $1836.25.

112. a. \( P(x) = R(x) - C(x) \)
   \[= 30x - (0.1x^2 + 7x + 400) \]
   \[= 30x - 0.1x^2 - 7x - 400 \]
   \[= -0.1x^2 + 23x - 400 \]

b. \( P(30) = -0.1(30)^2 + 23(30) - 400 \)
   \[= -90 + 690 - 400 \]
   \[= 200 \]

c. When 30 clocks are sold, the profit is $200.

113. a. \( R(v) = 2.2v; B(v) = 0.05v^2 + 0.4v - 15 \)
   \(D(v) = R(v) + B(v) \)
   \[= 2.2v + 0.05v^2 + 0.4v - 15 \]
   \[= 0.05v^2 + 2.6v - 15 \]

b. \( D(60) = 0.05(60)^2 + 2.6(60) - 15 \)
   \[= 180 + 156 - 15 \]
   \[= 321 \]

c. The car will need 321 feet to stop once the impediment is observed.

114. a. \( h(x) = 2x \)
   \(h(a + b) = 2(a + b) = 2a + 2b \)
   \(= h(a) + h(b) \)
   \[h(x) = 2x \text{ has the property.} \]

b. \( g(x) = x^2 \)
   \(g(a + b) = (a + b)^2 = a^2 + 2ab + b^2 \)
   Since \(a^2 + 2ab + b^2 \neq a^2 + b^2\), \(g(x) = x^2\) does not have the property.

c. \( F(x) = 5x - 2 \)
   \(F(a + b) = 5(a + b) - 2 = 5a + 5b - 2 \)
   Since \(5a + 5b - 2 \neq 5a - 2 + 5b - 2\), \(F(x) = 5x - 2\) does not have the property.

d. \( G(x) = \frac{1}{x} \)
   \(G(a + b) = \frac{1}{a + b} \neq \frac{1}{a} + \frac{1}{b} = G(a) + G(b) \)
   \[G(x) = \frac{1}{x} \text{ does not have the property.} \]

115. No. The domain of \(f\) is \(\{x | x \text{ is any real number}\}\),

117. \( \frac{3x - x^3}{(\text{your age})} \)
118.  

\[(x + 12)^2 + y^2 = 16\]

x-intercept (y=0):
\[(x + 12)^2 + 0^2 = 16\]
\[(x + 12)^2 = 16\]
\[(x + 12) = \pm 4\]
\[x = -16 \pm 4\]
\[x = -16, x = -8\]
\[(-16, 0), (-8, 0)\]

y-intercept (x=0):
\[(0 + 12)^2 + y^2 = 16\]
\[(12)^2 + y^2 = 16\]
\[y^2 = 16 - 144 = -128\]
There are no real solutions so there are no y-intercepts.

Symmetry: \[(x + 12)^2 + (-y)^2 = 16\]
\[(x + 12)^2 + y^2 = 16\]
This shows x-axis symmetry.

119.  

\[y = 3x^2 - 8\sqrt{x}\]
\[y = 3(-1)^2 - 8\sqrt{-1}\]
There is no solution so (-1, -5) is NOT a solution.
\[y = 3x^2 - 8\sqrt{x}\]
\[y = 3(4)^2 - 8\sqrt{4}\]
\[= 48 - 16 = 32\]
So (4, 32) is a solution.
\[y = 3x^2 - 8\sqrt{x}\]
\[y = 3(9)^2 - 8\sqrt{9}\]
\[= 243 - 24 = 219 \neq 171\]
So (9, 171) is NOT a solution.

120.  

\[P_1 = (3, -4), P_2 = (-6, 0)\]
The formula for midpoint is:
\[
\left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)
\]
\[
\left( \frac{3 + (-6)}{2}, \frac{-4 + 0}{2} \right)
\]
\[
\left( \frac{-3}{2}, \frac{-4}{2} \right)
\]
\[
\left( -\frac{3}{2}, -2 \right)
\]

121.  

\[(h, k) = (4, -1) \text{ and } r = 3\]
The general form of a circle is:
\[(x - h)^2 + (y - k)^2 = r^2\]
\[(x - 4)^2 + (y - (-1))^2 = (3)^2\]
\[(x - 4)^2 + (y + 1)^2 = 9\]

Section 2.2

1.  

\[x^2 + 4y^2 = 16\]
x-intercepts:
\[x^2 + 4(0)^2 = 16\]
x = 4
\[x = \pm 4 \Rightarrow (-4, 0), (4, 0)\]
y-intercepts:
\[(0)^2 + 4y^2 = 16\]
4y^2 = 16
y^2 = 4
\[y = \pm 2 \Rightarrow (0, -2), (0, 2)\]

   \((1, 1)\) and \((-1, 1)\) are on the graph of \(f\).

d. The domain of \(f\) is \(\{x \mid x \text{ is any real number}\}\).

e. \(x\)-intercept:
   \[
   f(x) = 0 \Rightarrow \frac{2x^2}{x^4 + 1} = 0 \\
   2x^2 = 0 \Rightarrow x = 0 \Rightarrow (0, 0)
   \]

f. \(y\)-intercept:
   \[
   f(0) = \frac{2(0)^2}{0^4 + 1} = \frac{0}{0+1} = 0 \Rightarrow (0, 0)
   \]

30. \( f(x) = \frac{2x}{x-2} \)

a. \( f\left(\frac{1}{2}\right) = \frac{2\left(\frac{1}{2}\right)}{\frac{1}{2} - 2} = \frac{1}{3} = -\frac{2}{3} \)
   The point \(\left(\frac{1}{2}, -\frac{2}{3}\right)\) is on the graph of \(f\).

b. \( f(4) = \frac{2(4)}{4 - 2} = \frac{8}{2} = 4 \)
   The point \((4, 4)\) is on the graph of \(f\).
c. Solve for \( x \):
\[
1 = \frac{2x}{x - 2} \Rightarrow x - 2 = 2x \Rightarrow -2 = x
\]
\((-2, 1)\) is a point on the graph of \( f \).

d. The domain of \( f \) is \( \{ x \mid x \neq 2 \} \).

e. \( x \)-intercept:
\[
(0, 0) \quad \text{and} \quad \left( 0, 0 \right) \quad \text{are} \quad \text{not} \quad \text{points} \quad \text{on} \quad \text{the} \quad \text{graph}.
\]
f. \( y \)-intercept:
\[
(0, 0) \quad \text{and} \quad \left( 0, 0 \right) \quad \text{are} \quad \text{not} \quad \text{points} \quad \text{on} \quad \text{the} \quad \text{graph}.
\]

31. a. \( (f + g)(2) = f(2) + g(2) = 2 + 1 = 3 \)

b. \( (f + g)(4) = f(4) + g(4) = 1 + (-3) = -2 \)

c. \( (g - f)(6) = g(6) - f(6) = 0 - 1 = -1 \)

d. \( (f \cdot g)(2) = f(2) \cdot g(2) = 2(1) = 2 \)

e. \( \left( \frac{f}{g} \right)(4) = \frac{f(4)}{g(4)} = \frac{1}{-3} = -\frac{1}{3} \)

32. \( h(x) = -\frac{136x^2}{v^2} + 2.7x + 3.5 \)

a. We want \( h(15) = 10 \).
\[
-\frac{136(15)^2}{v^2} + 2.7(15) + 3.5 = 10
\]
\[
-\frac{30,600}{v^2} = -34
\]
\[
v^2 = 900
\]
\[
v = 30 \text{ ft/sec}
\]
The ball needs to be thrown with an initial velocity of 30 feet per second.

b. \( h(x) = -\frac{126x^2}{30^2} + 2.7x + 3.5 \)

which simplifies to
\[
h(x) = -\frac{34}{225}x^2 + 2.7x + 3.5
\]

c. Using the velocity from part (b),
\[
h(9) = -\frac{34}{225}(9)^2 + 2.7(9) + 3.5 = 15.56 \text{ ft}
\]
The ball will be 15.56 feet above the floor when it has traveled 9 feet in front of the foul line.

d. Select several values for \( x \) and use these to find the corresponding values for \( h \). Use the results to form ordered pairs \((x, h)\). Plot the points and connect with a smooth curve.
\[
h(0) = -\frac{34}{225}(0)^2 + 2.7(0) + 3.5 = 3.5 \text{ ft}
\]
\[
h(5) = -\frac{34}{225}(5)^2 + 2.7(5) + 3.5 = 13.2 \text{ ft}
\]
\[
h(15) = -\frac{24}{225}(15)^2 + 2.7(15) + 3.5 = 10 \text{ ft}
\]
Thus, some points on the graph are \((0, 3.5)\), \((5, 13.2)\), and \((15, 10)\). The complete graph is given below.

33. \( h(x) = -\frac{44x^2}{v^2} + x + 6 \)

a. \( h(8) = -\frac{44(8)^2}{28^2} + (8) + 6
\]
\[
= -\frac{2816}{784} + 14
\]
\[
= 10.4 \text{ feet}
\]

b. \( h(12) = -\frac{44(12)^2}{28^2} + (12) + 6
\]
\[
= -\frac{6336}{784} + 18
\]
\[
= 9.9 \text{ feet}
\]

c. From part (a) we know the point \((8, 10.4)\) is on the graph and from part (b) we know the point \((12, 9.9)\) is on the graph. We could evaluate the function at several more values of \( x \) (e.g. \( x = 0 \), \( x = 15 \), and \( x = 20 \) to
obtain additional points.

\[ h(0) = \frac{-44(0)^2}{28^2} + (0) + 6 = 6 \]
\[ h(15) = \frac{-44(15)^2}{28^2} + (15) + 6 = 8.4 \]
\[ h(20) = \frac{-44(20)^2}{28^2} + (20) + 6 = 3.6 \]

Some additional points are \((0, 6)\), \((15, 8.4)\) and \((20, 3.6)\). The complete graph is given below.

d. \[ h(15) = \frac{-44(15)^2}{28^2} + (15) + 6 = 8.4 \text{ feet} \]

No; when the ball is 15 feet in front of the foul line, it will be below the hoop.
Therefore it cannot go through the hoop.

In order for the ball to pass through the hoop, we need to have \( h(15) = 10 \).

\[ 10 = \frac{-44(15)^2}{v^2} + (15) + 6 \]
\[ -11 = \frac{-44(15)^2}{v^2} \]
\[ v^2 = 4 \left( \frac{225}{4} \right) \]
\[ v^2 = 900 \]
\[ v = 30 \text{ ft/sec} \]

The ball must be shot with an initial velocity of 30 feet per second in order to go through the hoop.

34. \[ A(x) = 4x\sqrt{1-x^2} \]

a. Domain of \( A(x) = 4x\sqrt{1-x^2} \); we know that \( x \) must be greater than or equal to zero, since \( x \) represents a length. We also need \( 1-x^2 \geq 0 \), since this expression occurs under a square root. In fact, to avoid \( A = 0 \), we require
\[ x > 0 \text{ and } 1-x^2 > 0 . \]
Solve: \( 1-x^2 > 0 \)
\[ (1+x)(1-x) > 0 \]
Case1: \( 1+x > 0 \) and \( 1-x > 0 \)
\[ x > -1 \text{ and } x < 1 \]
(i.e. \( -1 < x < 1 \))

Case2: \( 1+x < 0 \) and \( 1-x < 0 \)
\[ x < -1 \text{ and } x > 1 \]
(which is impossible)
Therefore the domain of \( A \) is \( \{ x \mid 0 < x < 1 \} \).

b. Graphing \( A(x) = 4x\sqrt{1-x^2} \)

\[ \begin{array}{|c|c|}
\hline
\text{X} & \text{Y} \\
\hline
0 & 0 \\
.3 & 1.5664 \\
.5 & 1.9996 \\
.7 & 1.3568 \\
\hline
\end{array} \]

35. \[ h(x) = \frac{-32x^2}{130^2} + x \]

a. \[ h(100) = \frac{-32(100)^2}{130^2} + 100 \]
\[ = \frac{-320,000}{16,900} + 100 = 81.07 \text{ feet} \]

b. \[ h(300) = \frac{-32(300)^2}{130^2} + 300 \]
\[ = \frac{-2,880,000}{16,900} + 300 = 129.59 \text{ feet} \]
c. \( h(500) = \frac{-32(500)^2}{130^2} + 500 \)
   \[ = \frac{-8,000,000}{16,900} + 500 = 26.63 \text{ feet} \]

d. Solving \( h(x) = \frac{-32x^2}{130^2} + x = 0 \)
   \[ \frac{-32x^2}{130^2} + x = 0 \]
   \[ x \left( \frac{-32x + 130^2}{130^2} \right) = 0 \]
   \[ x = 0 \quad \text{or} \quad \frac{-32x + 130^2}{130^2} = 1 \]
   \[ \frac{-32x + 130^2}{130^2} = 1 \]
   \[ 130^2 = 32x \]
   \[ x = \frac{130^2}{32} = 528.13 \text{ feet} \]
   Therefore, the golf ball travels 528.13 feet.

e. \( y_1 = \frac{-32x^2}{130^2} + x \)

f. Use INTERSECT on the graphs of \( y_1 = \frac{-32x^2}{130^2} + x \) and \( y_2 = 90 \).

The ball reaches a height of 90 feet twice. The first time is when the ball has traveled approximately 115.07 feet, and the second time is when the ball has traveled about 413.05 feet.

g. The ball travels approximately 275 feet before it reaches its maximum height of approximately 131.8 feet.

h. The ball travels approximately 264 feet before it reaches its maximum height of approximately 132.03 feet.

36. \( W(h) = m \left( \frac{4000}{4000 + h} \right)^2 \)

a. \( h = 14110 \text{ feet} = 2.67 \text{ miles} \)
   \[ W(2.67) = 120 \left( \frac{4000}{4000 + 2.67} \right)^2 = 119.84 \]
   On Pike's Peak, Amy will weigh about 119.84 pounds.

b. Graphing:

c. Create a TABLE:

   The weight \( W \) will vary from 120 pounds to about 119.7 pounds.

d. By refining the table, Amy will weigh 119.95 lbs at a height of about 0.83 miles.

37. \( C(x) = 100 + \frac{x}{10} + \frac{36000}{x} \)

a. \( C(480) = 100 + \frac{480}{10} + \frac{36000}{480} = $223 \)
\( C(600) = 100 + \frac{600}{10} + \frac{36000}{600} = $220 \)

b. \( \{x \mid x > 0\} \)

c. Graphing:

\( d. \) The domain is \( \{g \mid 0 \leq g \leq 60\} \). This indicates that there are at most 60 gigabytes in a month.

e. The graph is flat at first and then rises in a straight line.

40. Answers will vary. From a graph, the domain can be found by visually locating the x-values for which the graph is defined. The range can be found in a similar fashion by visually locating the y-values for which the function is defined.

If an equation is given, the domain can be found by locating any restricted values and removing them from the set of real numbers. The range can be found by using known properties of the graph of the equation, or estimated by means of a table of values.

41. The graph of a function can have any number of x-intercepts. The graph of a function can have at most one y-intercept (otherwise the graph would fail the vertical line test).
42. Yes, the graph of a single point is the graph of a function since it would pass the vertical line test. The equation of such a function would be something like the following: \( f(x) = 2 \), where \( x = 7 \).

49. Answers (graphs) will vary. Points of the form \((5, y)\) and of the form \((x, 0)\) cannot be on the graph of the function.

50. The only such function is \( f(x) = 0 \) because it is the only function for which \( f(x) = -f(x) \). Any other such graph would fail the vertical line test.

   \(f(-x) = 4(-x)^3 = -4x^3 = -f(x)\)
   Therefore, \(f\) is odd.
38. \( f(x) = 2x^4 - x^2 \)
\[ f(-x) = 2(-x)^4 - (-x)^2 = 2x^4 - x^2 = f(x) \]
Therefore, \( f \) is even.

39. \( g(x) = -3x^2 - 5 \)

45. \( g(x) = \frac{1}{x^2} \)
\[ g(-x) = \frac{1}{(-x)^2} = \frac{1}{x^2} = g(x) \]
Therefore, \( g \) is even.

46. \( h(x) = \frac{x}{x^2 - 1} \)
\[ h(-x) = \frac{-x}{(-x)^2 - 1} = \frac{-x}{x^2 - 1} = -h(x) \]
Therefore, \( h \) is odd.

47. \( h(x) = \frac{-x^3}{3x^2 - 9} \)
\[ h(-x) = \frac{-(-x)^3}{3(-x)^2 - 9} = \frac{x^3}{3x^2 - 9} = -h(x) \]
Therefore, \( h \) is odd.

48. \( F(x) = \frac{2x}{|x|} \)
\[ F(-x) = \frac{2(-x)}{|-x|} = \frac{-2x}{|x|} = -F(x) \]

      \]
      \[

75. a. \( g(x) = x^3 - 27x \)
   \[ g(-x) = (-x)^3 - 27(-x) = -x^3 + 27x \]
   \[ = -g(x) \]
   Since \( g(-x) = -g(x) \), the function is odd.

b. Since \( g(x) \) is odd then it is symmetric about the origin so there exist a local maximum at \( x = -3 \).
   \[ g(-3) = (-3)^3 - 27(-3) = -27 + 81 = 54 \]
   So there is a local maximum of 54 at \( x = -3 \).

76. \( f(x) = -x^3 + 12x \)
   a. \[ f(-x) = -(-x)^3 + 12(-x) = -x^3 - 12x \]
   \[ = -f(x) \]
   Since \( f(-x) = -f(x) \), the function is odd.

b. Since \( f(x) \) is odd then it is symmetric about the origin so there exist a local maximum at \( x = 3 \).
   \[ f(2) = -(2)^3 + 12(2) = -8 + 24 = 16 \]
   So there is a local maximum of 16 at \( x = 2 \).

77. \( F(x) = -x^4 + 8x^2 + 8 \)
   a. \[ F(-x) = -(-x)^4 + 8(-x)^2 + 8 \]
   \[ = -x^4 + 8x^2 + 8 \]
   \[ = F(x) \]
   Since \( F(-x) = F(x) \), the function is even.

b. Since the function is even, its graph has y-axis symmetry. The second local maximum is in quadrant II and is 24 and occurs at \( x = -2 \).

c. Because the graph has y-axis symmetry, the area under the graph between \( x = 0 \) and \( x = 3 \) bounded below by the x-axis is the same as the area under the graph between \( x = -3 \) and \( x = 0 \) bounded below the x-axis. Thus, the area is 47.4 square units.

   a. \[ G(-x) = -(-x)^4 + 32(-x)^2 + 144 \]

   \[ = G(x) \]
   Since \( G(-x) = G(x) \), the function is even.

b. Since the function is even, its graph has y-axis symmetry. The second local maximum is in quadrant II and is 400 and occurs at \( x = -4 \).

c. Because the graph has y-axis symmetry, the area under the graph between \( x = 0 \) and \( x = 6 \) bounded below by the x-axis is the same as the area under the graph between \( x = -6 \) and \( x = 0 \) bounded below the x-axis. Thus, the area is 1612.8 square units.

\[ = 5.05 \text{ percentage points per year} \]

On average, the percentage of returns that are e-filed is increasing at a rate of 5.05 percentage points per year from 2007 to 2009.
c. avg. rate of change = $\frac{P(2012) - P(2010)}{2012 - 2010}$ 
= $\frac{82.7 - 69.8}{2012 - 2010}$ 
= $\frac{12.9}{2}$ 
= 6.45 percentage points per year

On overage, the percentage of returns that are e-filed is increasing at a rate of 6.45 percentage points per year from 2010 to 2012.

d. The average rate of change is increasing as time passes. This indicates that the percentage of e-filers is increasing at an increasing rate.

85. $f(x) = x^2$

a. Average rate of change of $f$ from $x = 0$ to $x = 1$:

$$f(1) - f(0) = \frac{1^2 - 0^2}{1 - 0} = 1$$

b. Average rate of change of $f$ from $x = 0$ to $x = 0.5$:

$$f(0.5) - f(0) = \frac{(0.5)^2 - 0^2}{0.5 - 0} = \frac{0.25}{0.5} = 0.5$$

c. Average rate of change of $f$ from $x = 0$ to $x = 0.1$:

$$f(0.1) - f(0) = \frac{(0.1)^2 - 0^2}{0.1 - 0} = \frac{0.01}{0.1} = 0.1$$

d. Average rate of change of $f$ from $x = 0$ to $x = 0.01$:

$$f(0.01) - f(0) = \frac{(0.01)^2 - 0^2}{0.01 - 0} = \frac{0.0001}{0.01} = 0.01$$

e. Average rate of change of $f$ from $x = 0$ to $x = 0.001$:

$$f(0.001) - f(0) = \frac{(0.001)^2 - 0^2}{0.001 - 0} = \frac{0.000001}{0.001} = 0.001$$

f. Graphing the secant lines:

g. The secant lines are beginning to look more and more like the tangent line to the graph of $f$ at the point where $x = 0$.

h. The slopes of the secant lines are getting smaller and smaller. They seem to be approaching the number zero.

      h = 0.01 \Rightarrow m_{sec} = 2 \\
      \text{as } h \rightarrow 0, \ m_{sec} \rightarrow 2
      \]
   c. Using the point \((1, f(1)) = (1, 7)\) and slope, \( m = 2 \), we get the secant line:

Chapter 2: Functions and Their Graphs

95. Answers will vary. One possibility follows:

\[
\begin{array}{c|c|c}
\text{x} & \text{y} \\
\hline
-1 & -2 \\
0 & -3 \\
2 & 6 \\
\end{array}
\]

96. Answers will vary. See solution to Problem 89 for one possibility.

97. A function that is increasing on an interval can have at most one x-intercept on the interval. The graph of \( f \) could not "turn" and cross it again or it would start to decrease.

98. An increasing function is a function whose graph goes up as you read from left to right.

\[
\begin{array}{c|c|c}
\text{x} & \text{y} \\
\hline
-3 & -5 \\
3 & 5 \\
\end{array}
\]

A decreasing function is a function whose graph goes down as you read from left to right.

99. To be an even function we need \( f(-x) = f(x) \) and to be an odd function we need \( f(-x) = -f(x) \). In order for a function be both even and odd, we would need \( f(x) = -f(x) \). This is only possible if \( f(x) = 0 \).

100. The graph of \( y = 5 \) is a horizontal line.

\[
\begin{array}{c|c|c|c|c}
\text{x} & \text{y} & \text{y} & \text{y} & \text{y} \\
\hline
-1 & 5 & 5 & 5 & 5 \\
0 & 5 & 5 & 5 & 5 \\
1 & 5 & 5 & 5 & 5 \\
\end{array}
\]

The local maximum is \( y = 5 \) and it occurs at each \( x \)-value in the interval.

101. Not necessarily. It just means \( f(5) > f(2) \).

The function could have both increasing and decreasing intervals.

102. \[
\frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{b-b}{x_2 - x_1} = 0
\]
\[
\frac{f(2) - f(-2)}{2 - (-2)} = \frac{0 - 0}{4} = 0
\]

103. \[
f(-3) = \frac{(-3)^2}{2(-3) + 5} = \frac{9}{-6 + 5} = \frac{9}{-1} = -9
\]

So the corresponding point is: \((-3, -9)\)

104. Let \( x \) be the number of miles driven. Then 0.80 represents the mileage charge. Let 40 be the fixed charge. Then the cost \( C \) to rent the truck is given by:

\[
C(x) = 0.80x + 40
\]

105. The slope of the perpendicular line would be

\[
-\frac{1}{m} = -\frac{1}{\frac{5}{3}} = -\frac{3}{5}
\]

\[
y - y_1 = m(x - x_1)
\]

\[
y - (-1) = -\frac{5}{3}(x - 3)
\]

\[
y + 1 = -\frac{5}{3}x + 5
\]

\[
y = -\frac{5}{3}x + 4
\]

106. \[
\frac{f(x+h) - f(x)}{h} = \frac{3(x+h)^2 - 5(x+h) - (3x^2 - 5x)}{h}
\]
\[
= \frac{3(x^2 + 2xh + h^2) - 5x - 5h - 3x^2 + 5x}{h}
\]
\[
= \frac{3x^2 + 6xh + 3h^2 - 5x - 5h - 3x^2 + 5x}{h}
\]
\[
= \frac{6xh + 3h^2 - 5h}{h}
\]
\[
= 6x + 3h - 5

64. Each graph is that of $y = x^2$, but shifted vertically.

If $y = x^2 + k$, $k > 0$, the shift is up $k$ units; if $y = x^2 - k$, $k > 0$, the shift is down $k$ units. The graph of $y = x^2 - 4$ is the same as the graph of $y = x^2$, but shifted down 4 units. The graph of $y = x^2 + 5$ is the graph of $y = x^2$, but shifted up 5 units.

65. Each graph is that of $y = x^2$, but shifted horizontally.

If $y = (x - k)^2$, $k > 0$, the shift is to the right $k$ units; if $y = (x + k)^2$, $k > 0$, the shift is to the left $k$ units. The graph of $y = (x + 4)^2$ is the same as the graph of $y = x^2$, but shifted to the left 4 units. The graph of $y = (x - 5)^2$ is the graph of $y = x^2$, but shifted to the right 5 units.

66. Each graph is that of $y = |x|$, but either compressed or stretched vertically.

If $y = k|x|$ and $k > 1$, the graph is stretched vertically; if $y = k|x|$ and $0 < k < 1$, the graph is compressed vertically. The graph of $y = \frac{1}{4}|x|$ is the same as the graph of $y = |x|$, but compressed vertically. The graph of $y = 5|x|$ is the same as the graph of $y = |x|$, but stretched vertically.

67. The graph of $y = -x^2$ is the reflection of the graph of $y = x^2$ about the $x$-axis.

The graph of $y = -|x|$ is the reflection of the graph of $y = |x|$ about the $x$-axis.

Multiplying a function by $-1$ causes the graph to be a reflection about the $x$-axis of the original function's graph.
68. The graph of \( y = \sqrt{-x} \) is the reflection about the \( y \)-axis of the graph of \( y = \sqrt{x} \).

The same type of reflection occurs when graphing \( y = 2x + 1 \) and \( y = 2(-x) + 1 \).

69. The graph of \( y = (x-1)^3 + 2 \) is a shifting of the graph of \( y = x^3 \) one unit to the right and two units up. Yes, the result could be predicted.

70. The graphs of \( y = x^n \), \( n \) a positive even integer, are all U-shaped and open upward. All go through the points \((-1, -1)\), \((0, 0)\), and \((1, 1)\). As \( n \) increases, the graph of the function is narrower for \( |x| > 1 \) and flatter for \( |x| < 1 \).

71. The graphs of \( y = x^n \), \( n \) a positive odd integer, all have the same general shape. All go through the points \((-1, -1)\), \((0, 0)\), and \((1, 1)\). As \( n \) increases, the graph of the function increases at a greater rate for \( |x| > 1 \) and is flatter around 0 for \( |x| < 1 \).

72. \( f(x) = \begin{cases} 1 & \text{if } x \text{ is rational} \\ 0 & \text{if } x \text{ is irrational} \end{cases} \)

Yes, it is a function.

Domain = \( \{ x \mid x \text{ is any real number} \} \) or \( (-\infty, \infty) \)

Range = \( \{ 0, 1 \} \) or \( \{ y \mid y = 0 \text{ or } y = 1 \} \)

\( y \)-intercept: \( x = 0 \Rightarrow y = 1 \)

So the \( y \)-intercept is \( y = 1 \).

\( x \)-intercept: \( y = 0 \Rightarrow x \) is irrational

So the graph has infinitely many \( x \)-intercepts, namely, there is an \( x \)-intercept at each irrational value of \( x \).

\( f(-x) = 1 = f(x) \) when \( x \) is rational;

\( f(-x) = 0 = f(x) \) when \( x \) is irrational.

Thus, \( f \) is even.

The graph of \( f \) consists of 2 infinite clusters of distinct points, extending horizontally in both directions. One cluster is located 1 unit above the \( x \)-axis, and the other is located along the \( x \)-axis.

73. For \( 0 < x < 1 \), the graph of \( y = x^r \), \( r \) rational and \( r > 0 \), flattens down toward the \( x \)-axis as \( r \) gets bigger. For \( x > 1 \), the graph of \( y = x^r \) increases at a greater rate as \( r \) gets bigger.

74. \( \sqrt{x^2 - 4} + 7 = 10 \)

\( \sqrt{x^2 - 4} = 3 \)

\( x = \pm \sqrt{13} \)

5. \( d \)
29. (1) \( y = -\sqrt{x} \)
   (2) \( y = -\sqrt{x + 2} \)
   (3) \( y = -\sqrt{x + 3} + 2 \)

30. (1) \( y = \sqrt{x + 2} \)
   (2) \( y = \sqrt{-x + 2} \)
   (3) \( y = \sqrt{-(x + 3) + 2} = \sqrt{-x - 3} + 2 \)

31. (c); To go from \( y = f(x) \) to \( y = -f(x) \) we reflect about the \( x \)-axis. This means we change the sign of the \( y \)-coordinate for each point on the graph of \( y = f(x) \). Thus, the point \((3, 6)\) would become \((3, -6)\).

32. (d); To go from \( y = f(x) \) to \( y = f(-x) \), we reflect each point on the graph of \( y = f(x) \) about the \( y \)-axis. This means we change the sign of the \( x \)-coordinate for each point on the graph of \( y = f(x) \). Thus, the point \((3, 6)\) would become \((-3, 6)\).

33. (c); To go from \( y = f(x) \) to \( y = 2f(x) \), we stretch vertically by a factor of 2. Multiply the \( y \)-coordinate of each point on the graph of \( y = f(x) \) by 2. Thus, the point \((1, 3)\) would become \((1, 6)\).

34. (c); To go from \( y = f(x) \) to \( y = f(2x) \), we compress horizontally by a factor of 2. Divide the \( x \)-coordinate of each point on the graph of \( y = f(x) \) by 2. Thus, the point \((4, 2)\) would become \((2, 2)\).

c. The local minimum can be found by using the Minimum feature from the CALC menu on a TI-84 Plus graphing calculator.

\[
egin{align*}
\text{The local minimum is approximately} & \quad -10.39 \text{ when } x = 1.73. \\
\end{align*}
\]

The local maximum can be found by using the Maximum feature from the CALC menu on a TI-84 Plus graphing calculator.

\[
\begin{align*}
\text{The local maximum is approximately} & \quad 10.39 \text{ when } x = -1.73. \\
\end{align*}
\]

d. From the graph above, we see that \( f \) is initially increasing, decreasing between the two extrema, and increasing again at the end. Thus, \( f \) is increasing on \([-4, -1.73]\) and on the interval \([1.73, 4]\). It is decreasing on the interval \([-1.73, 1.73]\).

e. \( y = f(x + 2) \) involves a shift to the left 2 units so we subtract 2 from each x-value. Therefore, we have the following:
   x-intercepts: \(-5, -2, \text{ and } 1\)
   local minimum: \(-10.39 \text{ when } x = -0.27\)
   local maximum: \(10.39 \text{ when } x = -3.73\)
   increasing on \([-6, -3.73]\) and \([-0.27, 2]\); decreasing on \([-3.73, -0.27]\).

f. \( y = 2f(x) \) involves a vertical stretch by a factor of 2 so we multiply each y-value by 2. Therefore, we have the following:
   x-intercepts: \(-3, 0, \text{ and } 3\)
   local minimum: \(-20.78 \text{ when } x = 1.73\)
   local maximum: \(20.78 \text{ when } x = -1.73\)
   increasing on \([-4, -1.73]\) and \([1.73, 4]\); decreasing on \([-1.73, 1.73]\).

g. \( y = f(-x) \) involves a reflection about the y-axis. Therefore, we have the following:
   x-intercepts: \(-3, 0, \text{ and } 3\)
   local minimum: \(-10.39 \text{ when } x = -1.73\)
   local maximum: \(10.39 \text{ when } x = 1.73\)
   increasing on \([-1.73, 1.73]\); decreasing on \([-4, -1.73]\) and \([1.73, 4]\).

68. a. \( f(x) = x^3 - 4x, -3 < x < 3 \)

\[
\begin{align*}
\text{The local minimum is approximately} & \quad -10.39 \text{ when } x = 1.73. \\
\end{align*}
\]

The local maximum is approximately 10.39 when \( x = -1.73 \).

d. From the graph above, we see that \( f \) is initially increasing, decreasing between the two extrema, and increasing again at the end. Thus, \( f \) is increasing on \([4, 1.73]\) and \([1.73, 4]\); decreasing on \([1.73, 1.73]\).

c. The local minimum can be found by using the Minimum feature from the CALC menu on a TI-84 Plus graphing calculator.

\[
\begin{align*}
\text{The local minimum is approximately} & \quad -3.08 \text{ when } x = 1.15. \\
\end{align*}
\]

The local maximum can be found by using the Maximum feature from the CALC menu on a TI-84 Plus graphing calculator.

\[
\begin{align*}
\end{align*}
\]
The local maximum is approximately 3.08 when $x = -1.15$.

d. From the graph above, we see that $f$ is initially increasing, decreasing between the two extrema, and increasing again at the end. Thus, $f$ is increasing on the interval $[-3, -1.15]$ and on the interval $[1.15, 3]$. It is decreasing on the interval $[-1.15, 1.15]$.

e. $y = f(x - 4)$ involves a shift to the right 4 units so we add 4 to each $x$-value. Therefore, we have the following:
- $x$-intercepts: 2, 4, and 6
- Local minimum: $-3.08$ when $x = 5.15$
- Local maximum: 3.08 when $x = 2.85$
- Increasing on $[1, 2.85]$ and $[5.15, 7]$;

f. $y = f(2x)$ involves a horizontal compression by a factor of 2 so we divide each $x$-value by 2. Therefore, we have the following:
- $x$-intercepts: $-1$, 0, and 1
- Local minimum: $-3.08$ when $x = 0.575$
- Local maximum: 3.08 when $x = -0.575$
- Increasing on $[-3/2, 0.575]$ and $[0.575, 3/2]$;
- Decreasing on $[-0.575, 0.575]$.

g. $y = -f(x)$ involves a reflection about the $x$-axis. Therefore, we have the following:
- $x$-intercepts: $-2$, 0, and 2
- Local minimum: $-3.08$ when $x = -1.15$
- Local maximum: 3.08 when $x = 1.15$
- Increasing on $[-1.15, 1.15]$;
- Decreasing on $[-3, -1.15]$ and $[1.15, 3]$.

69. $f(x) = x^2 + 2x$
   $f(x) = (x^2 + 2x + 1) - 1$
   $f(x) = (x + 1)^2 - 1$
   Using $f(x) = x^2$, shift left 1 unit and shift down 1 unit.

70. $f(x) = x^2 - 6x$
    $f(x) = (x^2 - 6x + 9) - 9$
    $f(x) = (x - 3)^2 - 9$
    Using $f(x) = x^2$, shift right 3 units and shift down 9 units.

71. $f(x) = x^2 - 8x + 1$
    $f(x) = (x^2 - 8x + 16) + 1 - 16$
    $f(x) = (x - 4)^2 - 15$
    Using $f(x) = x^2$, shift right 4 units and shift down 15 units.
Chapter 2: Functions and Their Graphs

72. \( f(x) = x^2 + 4x + 2 \)
    \[ f(x) = (x^2 + 4x + 4) + 2 - 4 \]
    \[ f(x) = (x + 2)^2 - 2 \]
    Using \( f(x) = x^2 \), shift left 2 units and shift down 2 units.

73. \( f(x) = 2x^2 - 12x + 19 \)
    \[ = 2(x^2 - 6x) + 19 \]
    \[ = 2(x^2 - 6x + 9) + 19 - 18 \]
    \[ = 2(x - 3)^2 + 1 \]
    Using \( f(x) = x^2 \), shift right 3 units, vertically stretch by a factor of 2, and then shift up 1 unit.

74. \( f(x) = 3x^2 + 6x + 1 \)
    \[ = 3(x^2 + 2x) + 1 \]
    \[ = 3(x^2 + 2x + 1) + 1 - 3 \]
    \[ = 3(x + 1)^2 - 2 \]
    Using \( f(x) = x^2 \), shift left 1 unit, vertically stretch by a factor of 3, and shift down 2 units.

75. \( f(x) = -3x^2 - 12x - 17 \)
    \[ = -3(x^2 + 4x) - 17 \]
    \[ = -3(x^2 + 4x + 4) - 17 + 12 \]
    \[ = -3(x + 2)^2 - 5 \]
    Using \( f(x) = x^2 \), shift left 2 units, stretch vertically by a factor of 3, reflect about the \( x \)-axis, and shift down 5 units.

76. \( f(x) = -2x^2 - 12x - 13 \)
    \[ = -2(x^2 + 6x) - 13 \]
    \[ = -2(x^2 + 6x + 9) - 13 + 18 \]
    \[ = -2(x + 3)^2 + 5 \]
    Using \( f(x) = x^2 \), shift left 3 units, stretch vertically by a factor of 2, reflect about the \( x \)-axis, and shift down 5 units.

b. The graph of \( y = -2f(x-2) + 1 \) is the graph of \( y = f(x) \) but shifted right 2 units, stretched vertically by a factor of 2, reflected about the \( x \)-axis, and shifted up 1 unit. Thus, the point \((1,3)\) becomes the point \((3,-5)\).

c. The graph of \( y = f(2x+3) \) is the graph of \( y = f(x) \) but shifted left 3 units and horizontally compressed by a factor of 2. Thus, the point \((1,3)\) becomes the point \((-1,3)\).

80. a. The graph of \( y = g(x+1) - 3 \) is the graph of \( y = g(x) \) but shifted left 1 unit and down 3 units. Thus, the point \((-3,5)\) becomes the point \((-4,2)\).

b. The graph of \( y = -3g(x-4) + 3 \) is the graph of \( y = g(x) \) but shifted right 4 units, stretched vertically by a factor of 3, reflected about the \( x \)-axis, and shifted up 3 units. Thus, the point \((-3,5)\) becomes the point \((1,-12)\).
c. The graph of \( y = g(3x + 9) \) is the graph of \( y = f(x) \) but shifted left 9 units and horizontally compressed by a factor of 3. Thus, the point \((-3, 5)\) becomes the point \((-4, 5)\).

81. **a.** \( f(x) = \text{int}(-x) \)

Reflect the graph of \( y = \text{int}(x) \) about the \( y \)-axis.

**b.** \( g(x) = -\text{int}(x) \)

Reflect the graph of \( y = \text{int}(x) \) about the \( x \)-axis.

82. **a.** \( f(x) = \text{int}(x - 1) \)

Shift the graph of \( y = \text{int}(x) \) right 1 unit.

**b.** \( g(x) = \text{int}(1 - x) = \text{int}(-(x - 1)) \)

83. **a.** \( f(x) = \lfloor x - 3 \rfloor - 3 \)

Using the graph of \( y = \lfloor x \rfloor \), horizontally shift to the right 3 units \( y = \lfloor x - 3 \rfloor \) and vertically shift downward 3 units \( y = \lfloor x - 3 \rfloor - 3 \).

**b.** \( A = \frac{1}{2}bh \)

\[ = \frac{1}{2}(6)(3) = 9 \]

The area is 9 square units.

84. **a.** \( f(x) = -2\lvert x - 4 \rvert + 4 \)

Using the graph of \( y = \lvert x \rvert \), horizontally shift to the right 4 units \( y = \lvert x - 4 \rvert \), vertically stretch by a factor of 2 and flip on the \( x \)-axis \( y = -2\lvert x - 4 \rvert \), and vertically shift upward 4
85. a. From the graph, the thermostat is set at 72°F during the daytime hours. The thermostat appears to be set at 65°F overnight.

b. To graph $y = T(t) - 2$, the graph of $T(t)$ is shifted down 2 units. This change will lower the temperature in the house by 2 degrees.

c. To graph $y = T(t + 1)$, the graph of $T(t)$ should be shifted left one unit. This change will cause the program to switch between the daytime temperature and overnight temperature one hour sooner. The home will begin warming up at 5am instead of 6am and will begin cooling down at 8pm instead of 9pm.

86. a. $R(0) = 28.6(0)^2 + 300(0) + 4843 = 4843$

The estimated worldwide music revenue for 2012 is $4843 million.

$R(3) = 28.6(3)^2 + 300(3) + 4843$

$= 6000.4$

The estimated worldwide music revenue for 2015 is $6000.4 million.

$R(5) = 28.6(5)^2 + 300(5) + 4843$

$= 7058$

The estimated worldwide music revenue for 2017 is $7058 million.

b. $r(x) = R(x - 2)$

$= 28.6(x - 2)^2 + 300(x - 2) + 4843$

$= 28.6(x^2 - 4x + 4) + 300(x - 2)$

$+ 4843$

$= 28.6x^2 - 114.4x + 114.4 + 300x - 600 + 4843$

$= 28.6x^2 + 185.6x + 4357.4$

c. The graph of $r(x)$ is the graph of $R(x)$ shifted 2 units to the left. Thus, $r(x)$ represents the estimated worldwide music revenue, $x$ years after 2010.

$r(2) = 28.6(2)^2 + 185.6(2) + 4357.4 = 4843$

The estimated worldwide music revenue for 2012 is $4843 million.
Chapter 2: Functions and Their Graphs

\[ r(5) = 28.6(5)^2 + 185.6(5) + 4357.4 = 6000.4 \]
The estimated worldwide music revenue for 2015 is $6,000.4 million.

\[ r(7) = 28.6(7)^2 + 185.6(7) + 4357.4 = 7058 \]
The estimated worldwide music revenue for 2017 is $7,058 million.

d. In \( r(x) \), \( x \) represents the number of years after 2010 (see the previous part).

e. Answers will vary. One advantage might be that it is easier to determine what value should be substituted for \( x \) when using \( r(x) \) instead of \( R(x) \) to estimate worldwide music revenue.

88. a. \[ T = 2\pi \sqrt{\frac{l}{g}} \]

\[ T_1 = 2\pi \sqrt{\frac{l + 1}{g}} ; \quad T_2 = 2\pi \sqrt{\frac{l + 2}{g}} ; \quad T_3 = 2\pi \sqrt{\frac{l + 3}{g}} \]

\[ X_{\text{min}} = -1 \]
\[ X_{\text{max}} = 9 \]
\[ X_{\text{scl}} = 1 \]
\[ Y_{\text{min}} = -1 \]
\[ Y_{\text{max}} = 9 \]
\[ Y_{\text{scl}} = 1 \]
\[ X_{\text{res}} = 1 \]
\[ Y_{\text{res}} = 1 \]

c. As the length of the pendulum increases, the period increases.

d. \[ T_1 = 2\pi \sqrt{\frac{2l}{g}} ; \quad T_2 = 2\pi \sqrt{\frac{3l}{g}} ; \quad T_3 = 2\pi \sqrt{\frac{4l}{g}} \]

\[ X_{\text{min}} = -3 \]
\[ X_{\text{max}} = 7 \]
\[ X_{\text{scl}} = 1 \]
\[ Y_{\text{min}} = -1 \]
\[ Y_{\text{max}} = 9 \]
\[ Y_{\text{scl}} = 1 \]
\[ X_{\text{res}} = 1 \]
\[ Y_{\text{res}} = 1 \]

e. If the length of the pendulum is multiplied by \( k \), the period is multiplied by \( \sqrt{k} \).

89. \[ y = (x - c)^2 \]

If \( c = 0 \), \( y = x^2 \).

If \( c = 3 \), \( y = (x - 3)^2 \); shift right 3 units.

If \( c = -2 \), \( y = (x + 2)^2 \); shift left 2 units.
90.  \( y = x^2 + c \)
If \( c = 0 \), \( y = x^2 \).
If \( c = 3 \), \( y = x^2 + 3 \); shift up 3 units.
If \( c = -2 \), \( y = x^2 - 2 \); shift down 2 units.

91.  The graph of \( y = 4f(x) \) is a vertical stretch of the graph of \( f \) by a factor of 4, while the graph of \( y = f(4x) \) is a horizontal compression of the graph of \( f \) by a factor of \( \frac{1}{4} \).

92.  The graph of \( y = f(x) - 2 \) will shift the graph of \( y = f(x) \) down by 2 units. The graph of \( y = f(x - 2) \) will shift the graph of \( y = f(x) \) to the right by 2 units.

93.  The graph of \( y = \sqrt{-x} \) is the graph of \( y = \sqrt{x} \) but reflected about the y-axis. Therefore, our region is simply rotated about the y-axis and does not change shape. Instead of the region being bounded on the right by \( x = 4 \), it is bounded on the left by \( x = -4 \). Thus, the area of the second region would also be \( \frac{16}{3} \) square units.

94.  The range of \( f(x) = x^2 \) is \([0, \infty)\). The graph of \( g(x) = f(x) + k \) is the graph of \( f \) shifted up \( k \) units if \( k > 0 \) and shifted down \( |k| \) units if \( k < 0 \), so the range of \( g \) is \([k, \infty)\).

95.  The domain of \( g(x) = \sqrt{x} \) is \([0, \infty)\). The graph of \( g(x - k) \) is the graph of \( g \) shifted \( k \) units to the right, so the domain of \( g \) is \([k, \infty)\).

96.  \( 3x - 5y = 30 \)
\[-5y = 3x - 30 \]
\[y = \frac{3}{5}x - 6 \]
The slope is \( \frac{3}{5} \) and the y-intercept is -6.

97.  \( f(-x) = \frac{(-x)^2 + 2}{3(-x)} = \frac{x^2 + 2}{-3x} \)
\[= -\frac{x^2 + 2}{3x} = -f(x) \]
Since \( f(-x) = -f(x) \) then \( f(x) \) is odd.

98.  \( f(2) = (2)^4 - 7(2)^2 + 3(2) + 9 \)
\[= 16 - 28 + 6 + 9 = 3 \]
\( f(-2) = (-2)^4 - 7(-2)^2 + 3(-2) + 9 \)
\[= 16 - 28 - 6 + 9 = -9 \]
\( \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{3 - (-9)}{2 - (-2)} = \frac{12}{4} = 3 \)

99.  \( y^2 = x + 4 \)
\( x\)-intercepts:
\( (0)^2 = x + 4 \quad y^2 = 0 + 4 \)
\( 0 = x + 4 \quad y^2 = 4 \)
\( x = -4 \quad y = \pm 2 \)
The intercepts are \((-4, 0), (0, -2) \) and \((0, 2) \).

Test x-axis symmetry: Let \( y = -y \)
\((-y)^2 = x + 4 \quad y^2 = x + 4 \) same

Test y-axis symmetry: Let \( x = -x \)
\( y^2 = -x + 4 \) different

Test origin symmetry: Let \( x = -x \) and \( y = -y \)
\((-y)^2 = -x + 4 \quad y^2 = -x + 4 \) different
Therefore, the graph will have x-axis symmetry.
Section 2.6

1. a. The distance $d$ from $P$ to the origin is $d = \sqrt{x^2 + y^2}$. Since $P$ is a point on the graph of $y = x^2 - 8$, we have:

$$d(x) = \sqrt{x^2 + (x^2 - 8)^2} = \sqrt{x^4 - 15x^2 + 64}$$

b. $d(0) = \sqrt{0^4 - 15(0)^2 + 64} = \sqrt{64} = 8$

c. $d(1) = \sqrt{(1)^4 - 15(1)^2 + 64} = \sqrt{1 - 15 + 64} = \sqrt{50} = 5\sqrt{2} = 7.07$

d. $d$ is smallest when $x = -2.74$ or when $x = 2.74$.

e. $d$ is smallest when $x = -2.55$ or when $x = 2.55$.

3. a. The distance $d$ from $P$ to the point $(1, 0)$ is $d = \sqrt{(x-1)^2 + y^2}$. Since $P$ is a point on the graph of $y = \sqrt{x}$, we have:

$$d(x) = \sqrt{(x-1)^2 + \left(\sqrt{x}\right)^2} = \sqrt{x^2 - x + 1}$$

where $x \geq 0$.

b. $d$ is smallest when $x = \frac{1}{2}$.

e. $d$ is smallest when $x = \frac{1}{2}$.

4. a. The distance $d$ from $P$ to the origin is $d = \sqrt{x^2 + y^2}$. Since $P$ is a point on the graph of $y = \frac{1}{x}$, we have:

$$d(x) = \sqrt{x^2 + \left(\frac{1}{x}\right)^2} = \sqrt{x^2 + \frac{1}{x^2}} = \sqrt{x^2 + \frac{1}{x^2}}$$

$$= \sqrt{\frac{x^2 + 1}{x^2}}$$

d. $d$ is smallest when $x = 0$.

c. \( d \) is smallest when \( x = -1 \) or \( x = 1 \).

5. By definition, a triangle has area
\[ A = \frac{1}{2}bh, \quad b = \text{base}, \quad h = \text{height}. \]
From the figure, we know that \( b = x \) and \( h = y \). Expressing the area of the triangle as a function of \( x \), we have:
\[ A(x) = \frac{1}{2}xy = \frac{1}{2}x(x^3) = \frac{1}{2}x^4. \]

6. By definition, a triangle has area
\[ A = \frac{1}{2}bh, \quad b = \text{base}, \quad h = \text{height}. \]
Because one vertex of the triangle is at the origin and the other is on the \( x \)-axis, we know that \( b = x \) and \( h = y \). Expressing the area of the triangle as a function of \( x \), we have:
\[ A(x) = \frac{1}{2}xy = \frac{1}{2}x(9 - x^2) = \frac{9}{2}x - \frac{1}{2}x^3. \]

7. a. \( A(x) = xy = x(16 - x^2) \)
b. Domain: \( \{ x \mid 0 < x < 4 \} \)
c. The area is largest when \( x = 2.31 \).

8. a. \( A(x) = 2xy = 2x\sqrt{4-x^2} \)
b. \( p(x) = 2(2x) + 2(2y) = 4x + 4\sqrt{4-x^2} \)
c. Graphing the area equation:

9. a. In Quadrant I, \( x^2 + y^2 = 4 \rightarrow y = \sqrt{4-x^2} \)
\[ A(x) = (2x)(2y) = 4x\sqrt{4-x^2} \]
b. \( p(x) = 2(2x) + 2(2y) = 4x + 4\sqrt{4-x^2} \)
c. Graphing the area equation:

The area is largest when \( x = 1.41 \).
**Chapter 2: Functions and Their Graphs**

10. a. \( A(r) = (2r)(2r) = 4r^2 \)

   b. \( p(r) = 4(2r) = 8r \)

11. a. \( C = \text{circumference, } A = \text{total area, } \\
               r = \text{radius, } x = \text{side of square} \\
               C = 2\pi r = 10 - 4x \Rightarrow r = \frac{5 - 2x}{\pi} \)

   Total Area = area_{square} + area_{circle} = x^2 + \pi r^2
   \[ A(x) = x^2 + \pi \left(\frac{5 - 2x}{\pi}\right)^2 = x^2 + \frac{25 - 20x + 4x^2}{\pi} \]

   b. Since the lengths must be positive, we have:
      \( 10 - 4x > 0 \quad \text{and} \quad x > 0 \)
      \( -4x > -10 \quad \text{and} \quad x > 0 \)
      \( x < 2.5 \quad \text{and} \quad x > 0 \)
   
   Domain: \( \{x \mid 0 < x < 2.5\} \)
   
   c. The total area is smallest when \( x = 1.40 \) meters.

12. a. \( C = \text{circumference, } A = \text{total area, } \\
               r = \text{radius, } x = \text{side of equilateral triangle} \\
               C = 2\pi r = 10 - 3x \Rightarrow r = \frac{10 - 3x}{2\pi} \)

   The height of the equilateral triangle is \( \frac{\sqrt{3}}{2} x \).

   Total Area = area_{triangle} + area_{circle}
   \[ A(x) = \frac{\sqrt{3}}{4} x^2 + \pi \left(\frac{10 - 3x}{2\pi}\right)^2 \]
   \[ = \frac{\sqrt{3}}{4} x^2 + \frac{100 - 60x + 9x^2}{4\pi} \]

   b. Since the lengths must be positive, we have:
      \( 10 - 3x > 0 \quad \text{and} \quad x > 0 \)
      \( -3x > -10 \quad \text{and} \quad x > 0 \)
      \( x < \frac{10}{3} \quad \text{and} \quad x > 0 \)
   
   Domain: \( \{x \mid -\frac{10}{3} < x < 2.5\} \)
   
   c. The area is smallest when \( x = 2.08 \) meters.

13. a. Since the wire of length \( x \) is bent into a circle, the circumference is \( x \). Therefore, \( C(x) = x \).

   b. Since \( C = x = 2\pi r \), \( r = \frac{x}{2\pi} \).

   \[ A(x) = \pi r^2 = \pi \left(\frac{x}{2\pi}\right)^2 = \frac{x^2}{4\pi} \]
14. a. Since the wire of length $x$ is bent into a square, the perimeter is $x$. Therefore, $p(x) = x$.

b. Since $P = x = 4s$, $s = \frac{1}{4} x$, we have $A(x) = s^2 = \left(\frac{1}{4} x\right)^2 = \frac{1}{16} x^2$.

15. a. $A = \text{area}$, $r = \text{radius}$; diameter $2r$ 
$A(r) = (2r)(r) = 2r^2$

b. $p = \text{perimeter}$
$p(r) = 2(2r) + 2r = 6r$

16. $C = \text{circumference}$, $r = \text{radius}$;
$x = \text{length of a side of the triangle}$

Since $\triangle ABC$ is equilateral, $EM = \frac{\sqrt{3}x}{2}$.

Therefore, $OM = \frac{\sqrt{3}x}{2} - OE = \frac{\sqrt{3}x}{2} - r$

In $\triangle OAM$, $r^2 = \left(\frac{x}{2}\right)^2 + \left(\frac{\sqrt{3}x}{2} - r\right)^2$

$r^2 = \frac{x^2}{4} + \frac{3}{4} x^2 - \sqrt{3}rx + r^2$

$\sqrt{3}rx = x^2$

$r = \frac{x}{\sqrt{3}}$

Therefore, the circumference of the circle is $C(x) = 2\pi r = 2\pi \left(\frac{x}{\sqrt{3}}\right) = \frac{2\pi \sqrt{3}}{3} x$

17. Area of the equilateral triangle

$A = \frac{1}{2} x \cdot \frac{\sqrt{3}}{2} x = \frac{\sqrt{3}}{4} x^2$

From problem 16, we have $r^2 = \frac{x^2}{3}$.

Area inside the circle, but outside the triangle:

$A(x) = \pi r^2 - \frac{\sqrt{3}}{4} x^2$

$= \pi \left(\frac{\sqrt{3}}{3} \frac{x}{\sqrt{3}} \right)^2$

18. $d^2 = d_1^2 + d_2^2$

$d^2 = (30t)^2 + (40t)^2$

$d(t) = \sqrt{900t^2 + 1600t^2} = \sqrt{2500t^2} = 50t$

$d_1 = 40t$

$d_2 = 30t$

19. a. $d^2 = d_1^2 + d_2^2$

$d^2 = (2 - 30t)^2 + (3 - 40t)^2$

$d(t) = \sqrt{(2 - 30t)^2 + (3 - 40t)^2}$

$= \sqrt{4 - 120t + 900t^2 + 9 - 240t + 1600t^2}$

$= \sqrt{2500t^2 - 360t + 13}$

$b. The distance is smallest at \( t = 0.07 \) \text{ hours.}$

20. $r = \text{radius of cylinder}$, $h = \text{height of cylinder}$,
$V = \text{volume of cylinder}$

$r^2 + \left(\frac{h}{2}\right)^2 = R^2 \Rightarrow r^2 + \frac{h^2}{4} = R^2 \Rightarrow r^2 = R^2 - \frac{h^2}{4}$

$V = \pi r^2 h$

$V(h) = \pi \left(R^2 - \frac{h^2}{4}\right) h = \pi h \left(R^2 - \frac{h^2}{4}\right)$
21. \( r = \text{radius of cylinder}, \ h = \text{height of cylinder}, \ V = \text{volume of cylinder} \)

By similar triangles:
\[
\frac{H}{R} = \frac{H - h}{r}
\]
\[
Hr = R(H - h)
\]
\[
R = RH - Rh
\]
\[
h = \frac{RH - Hr}{R} = \frac{H(R - r)}{R}
\]
\[
V = \pi r^2 h = \pi r^2 \left( \frac{H(R - r)}{R} \right) = \pi H\left( \frac{R - r}{R} \right) r^2
\]

22. a. The total cost of installing the cable along the road is 500x. If cable is installed \( x \) miles along the road, there are \( 5 - x \) miles between the road to the house and where the cable ends along the road.

\[
d = \sqrt{(5 - x)^2 + 2^2} = \sqrt{25 - 10x + x^2 + 4} = \sqrt{x^2 - 10x + 29}
\]
The total cost of installing the cable is:
\[C(x) = 500x + 700\sqrt{x^2 - 10x + 29}
\]
Domain: \( \{x | 0 \leq x \leq 5\} \)

b. \( C(1) = 500(1) + 700\sqrt{1^2 - 10(1) + 29} = 500 + 700\sqrt{20} = $3630.50 \)
c. \( C(3) = 500(3) + 700\sqrt{3^2 - 10(3) + 29} = 1500 + 700\sqrt{8} = $3479.90 \)

23. a. The time on the boat is given by \( \frac{d_1}{3} \). The time on land is given by \( \frac{12 - x}{5} \).

\[
d_1 = \sqrt{x^2 + 2^2} = \sqrt{x^2 + 4}
\]
The total time for the trip is:
\[T(x) = \frac{12 - x}{5} + \frac{d_1}{3} = \frac{12 - x}{5} + \frac{\sqrt{x^2 + 4}}{3}
\]

b. Domain: \( \{x | 0 \leq x \leq 12\} \)
c. \( T(4) = \frac{12 - 4}{5} + \frac{4^2 + 4}{3} = \frac{8 + \sqrt{20}}{5} = 3.09 \text{ hours} \)
d. \( T(8) = \frac{12 - 8}{5} + \frac{8^2 + 4}{3} = \frac{4 + \sqrt{68}}{5} = 3.55 \text{ hours} \)
24. Consider the diagrams shown below.

There is a pair of similar triangles in the diagram. Since the smaller triangle is similar to the larger triangle, we have the proportion
\[ \frac{r}{h} = \frac{4}{16} \Rightarrow \frac{r}{h} = \frac{1}{4} \Rightarrow r = \frac{1}{4} h. \]
Substituting into the volume formula for the conical portion of water gives
\[ V(h) = \frac{1}{3} \pi r^2 h = \frac{1}{3} \pi \left( \frac{1}{4} h \right)^2 h = \frac{\pi}{48} h^3. \]

25. a. length = 24 – 2x; width = 24 – 2x; height = x
\[ V(x) = x(24 – 2x)(24 – 2x) = x(24 – 2x)^2 \]
b. \[ V(3) = 3(24 – 2(3))^2 = 3(18)^2 \]
\[ = 3(324) = 972 \text{ in}^3. \]
c. \[ V(10) = 10(24 – 2(10))^2 = 10(4)^2 \]
\[ = 10(16) = 160 \text{ in}^3. \]
d. \[ y_1 = x(24 – 2x)^2 \]

The volume is largest when \( x = 4 \) inches.

26. a. Let \( A = \text{amount of material} \), \( x = \text{length of the base} \), \( h = \text{height} \), and \( V = \text{volume} \).
\[ V = x^2 h = 10 \Rightarrow h = \frac{10}{x^2} \]
Total Area \( A = \text{(Area}_{\text{base}}) + \text{(4)(Area}_{\text{side}}) \)
\[ = x^2 + 4xh \]
\[ = x^2 + 4x \left( \frac{10}{x^2} \right) \]
\[ = x^2 + \frac{40}{x} \]
\[ A(x) = x^2 + \frac{40}{x} \]
b. \( A(1) = 1^2 + \frac{40}{1} = 1 + 40 = 41 \text{ ft}^2 \)
c. \( A(2) = 2^2 + \frac{40}{2} = 4 + 20 = 24 \text{ ft}^2 \)
d. \( y_1 = x^2 + \frac{40}{x} \)

The amount of material is least when \( x = 2.71 \) ft.
27. The center would be the midpoint 
\[(h, k) = \left( \frac{4 + (-6)}{2}, \frac{-5 + 3}{2} \right) \]
\[= \left( \frac{-2}{2}, \frac{-2}{2} \right) = (-1, -1) \]
The distance from the midpoint to one of the point would be the radius.
\[r = \sqrt{(1 - 4)^2 + (-1 - (-5))^2} = \sqrt{(-5)^2 + (4)^2} \]
\[= \sqrt{25 + 16} = \sqrt{41} \]

28. In order for the 16-foot long Ford Fusion to pass the 50-foot truck, the Ford Fusion must travel the length of the truck and the length of itself in the time frame of 5 seconds. Thus the Fusion must travel an additional 66 feet in 5 seconds.

Convert this to miles-per-hour.
5 sec = \( \frac{5}{60} \) min = \( \frac{5}{3600} \) hr = \( \frac{1}{720} \) hr.
66 ft = \( \frac{66}{5280} \) mi

\[\text{speed} = \frac{\text{distance}}{\text{time}} = \frac{66}{\frac{1}{720}} = 9 \text{ mph} \]
Since the truck is traveling 55 mph, the Fusion must travel 55 + 9 = 64 mph.

29. Start with \( y = x^2 \). To shift the graph left 4 units would change the function to \( y = (x + 4)^2 \). To shift the graph down 2 units would change the function to \( y = (x + 4)^2 - 2 \).

Chapter 2 Test

1. a. \{ (2.5), (4,6), (6,7), (8,8) \}

This relation is a function because there are no ordered pairs that have the same first element and different second elements.

Domain: \{ 2, 4, 6, 8 \}

Range: \{ 5, 6, 7, 8 \}

b. \{ (1.3), (4, -2), (-3.5), (1, 7) \}

This relation is not a function because there are two ordered pairs that have the same first element but different second elements.

c. This relation is not a function because the graph fails the vertical line test.

d. This relation is a function because it passes the vertical line test.

Domain: \{ x \mid x \text{ is any real number} \}

Range: \{ y \mid y \geq 2 \} or \( [2, \infty) \)

2. \( f(x) = \sqrt{4 - 5x} \)

The function tells us to take the square root of \( 4 - 5x \). Only nonnegative numbers have real square roots so we need \( 4 - 5x \geq 0 \).

\[
\begin{align*}
4 - 5x & \geq 0 \\
4 - 5x & = 0 - 4 \\
-5x & = -4 \\
-5 & \geq -4 \\
x & \leq \frac{4}{5} \\
\end{align*}
\]

Domain: \( \{ x \mid x \leq \frac{4}{5} \} \) or \( (-\infty, \frac{4}{5}] \)

\[
f(-1) = \sqrt{4 - 5(-1)} = \sqrt{9} = 3
\]

3. \( g(x) = \frac{x + 2}{|x + 2|} \)

The function tells us to divide \( x + 2 \) by \( |x + 2| \).
Division by 0 is undefined, so the denominator can never equal 0. This means that \( x \neq -2 \).

Domain: \{ \{ x \mid x \neq -2 \} \}

\[
g(-1) = \frac{(-1) + 2}{|(-1) + 2|} = \frac{1}{1} = 1
\]

4. \( h(x) = \frac{x - 4}{x^2 + 5x - 36} \)

The function tells us to divide \( x - 4 \) by \( x^2 + 5x - 36 \). Since division by 0 is not defined, we need to exclude any values which make the denominator 0.

\[
x^2 + 5x - 36 = 0
\]

\[
(x + 9)(x - 4) = 0
\]

\[
x = -9 \text{ or } x = 4
\]

Domain: \{ \{ x \mid x \neq -9, x \neq 4 \} \}

(note: there is a common factor of \( x - 4 \) but we must determine the domain prior to simplifying)

\[
h(-1) = \frac{(-1) - 4}{(-1)^2 + 5(-1) - 36} = \frac{-5}{-40} = \frac{1}{8}
\]

5. a. To find the domain, note that all the points on the graph will have an \( x \)-coordinate between \(-5 \) and 5, inclusive. To find the range, note that all the points on the graph will have a \( y \)-coordinate between \(-3 \) and 3, inclusive.

Domain: \{ \{ x \mid -5 \leq x \leq 5 \} \} or \( [-5, 5] \)

Range: \{ \{ y \mid -3 \leq y \leq 3 \} \} or \( [-3, 3] \)

b. The intercepts are \( (0, 2) \), \( (-2, 0) \), and \( (2, 0) \).

\( x \)-intercepts: \(-2, 2\)

\( y \)-intercept: \( 2 \)

c. \( f(1) \) is the value of the function when \( x = 1 \). According to the graph, \( f(1) = 3 \).

d. Since \(-5, -3 \) and \( (3, -3) \) are the only points on the graph for which \( y = f(x) = -3 \), we have \( f(x) = -3 \) when \( x = -5 \) and \( x = 3 \).
Chapter 2: Functions and Their Graphs

e. To solve \( f(x) < 0 \), we want to find \( x \)-values such that the graph is below the \( x \)-axis. The graph is below the \( x \)-axis for values in the domain that are less than \(-2\) and greater than \(2\). Therefore, the solution set is \( \{x | -5 \leq x < -2 \text{ or } 2 < x \leq 5\} \). In interval notation we would write the solution set as \([-5,-2) \cup (2,5]\).

6. \( f(x) = -x^4 + 2x^3 + 4x^2 - 2 \)

We set \( \text{Xmin} = -5 \) and \( \text{Xmax} = 5 \). The standard \( \text{Ymin} \) and \( \text{Ymax} \) will not be good enough to see the whole picture so some adjustment must be made.

We see that the graph has a local maximum of \(-0.86\) (rounded to two places) when \( x = -0.85 \) and another local maximum of \(15.55\) when \( x = 2.35 \). There is a local minimum of \(-2\) when \( x = 0 \). Thus, we have

Local maxima: \( f(-0.85) = -0.86 \)

Local minima: \( f(0) = -2 \)

The function is increasing on the intervals \([-5,-0.85]\) and \([0,2.35]\) and decreasing on the intervals \([-0.85,0]\) and \([2.35,5]\).

7. a. \( f(x) =\begin{cases} 2x + 1 & x < -1 \\ x - 4 & x \geq -1 \end{cases} \)

To graph the function, we graph each “piece”. First we graph the line \( y = 2x + 1 \) but only keep the part for which \( x < -1 \). Then we plot the line \( y = x - 4 \) but only keep the part for which \( x \geq -1 \).

b. To find the intercepts, notice that the only piece that hits either axis is \( y = x - 4 \).

\[
\begin{align*}
  y &= x - 4 \\
  y &= 0 - 4 \\
  y &= 4 - x \\
  y &= -4
\end{align*}
\]

The intercepts are \((0, -4)\) and \((4, 0)\).

c. To find \( g(-5) \) we first note that \( x = -5 \) so we must use the first “piece” because \(-5 < -1\).

\( g(-5) = 2(-5) + 1 = -10 + 1 = -9 \)

d. To find \( g(2) \) we first note that \( x = 2 \) so we must use the second “piece” because \( 2 \geq -1 \).

\( g(2) = 2 - 4 = -2 \)

8. The average rate of change from 3 to 4 is given by

\[
\frac{\Delta y}{\Delta x} = \frac{f(4) - f(3)}{4 - 3}
\]

\[
= \frac{(3(4)^2 - 2(4) + 4) - (3(3)^2 - 2(3) + 4)}{4 - 3}
\]

\[
= \frac{44 - 25}{4 - 3} = \frac{19}{1} = 19
\]

9. a. \( (f - g)(x) = (2x^2 + 1) - (3x - 2) = 2x^2 + 1 - 3x + 2 = 2x^2 - 3x + 3 \)

b. \( (f \cdot g)(x) = (2x^2 + 1)(3x - 2) = 6x^3 - 4x^2 + 3x - 2 \)

c. \( f(x + h) = f(x) = \frac{(2(x + h)^2 + 1) - (2x^2 + 1)}{2(2x^2 + 2xh + h^2 + 1) - (2x^2 + 1)} = \frac{2x^2 + 4xh + 2h^2 + 1 - 2x^2 - 1}{4xh + 2h^2} = \frac{4xh + 2h^2}{4xh + 2h^2} = 1 \)
10. a. The basic function is \( y = x^3 \) so we start with the graph of this function.

Next we shift this graph 1 unit to the left to obtain the graph of \( y = (x+1)^3 \).

Next we reflect this graph about the x-axis to obtain the graph of \( y = -(x+1)^3 \).

Next we stretch this graph vertically by a factor of 2 to obtain the graph of \( y = -2(x+1)^3 \).

The last step is to shift this graph up 3 units to obtain the graph of \( y = -2(x+1)^3 + 3 \).

b. The basic function is \( y = |x| \) so we start with the graph of this function.

Next we shift this graph 4 units to the left to obtain the graph of \( y = |x+4| \).

Next we shift this graph up 2 units to obtain the graph of \( y = |x+4| + 2 \).
11. a. \( r(x) = -0.115x^2 + 1.183x + 5.623 \)
   For the years 1992 to 2004, we have values of \( x \) between 0 and 12. Therefore, we can let \( X_{\text{min}} = 0 \) and \( X_{\text{max}} = 12 \). Since \( r \) is the interest rate as a percent, we can try letting \( Y_{\text{min}} = 0 \) and \( Y_{\text{max}} = 10 \).

   ![Function Graph]

   The highest rate during this period appears to be 8.67\%, occurring in 1997 (\( x = 5 \)).

b. For 2010, we have \( x = 2010 - 1992 = 18 \).
   \[ r(18) = -0.115(18)^2 + 1.183(18) + 5.623 = -10.343 \]
   The model predicts that the interest rate will be -10.343\%. This is not a reasonable value since it implies that the bank would be paying interest to the borrower.

12. a. Let \( x \) = width of the rink in feet. Then the length of the rectangular portion is given by \( 2x - 20 \). The radius of the semicircular portions is half the width, or \( r = \frac{x}{2} \).

   To find the volume, we first find the area of the surface and multiply by the thickness of the ice. The two semicircles can be combined to form a complete circle, so the area is given by
   \[ A = l \cdot w + \pi r^2 \]
   \[ = (2x - 20)(x) + \pi \left( \frac{x}{2} \right)^2 \]
   \[ = 2x^2 - 20x + \frac{\pi x^2}{4} \]
   We have expressed our measures in feet so we need to convert the thickness to feet as well.

   ![Volume Graph]

   The volume of ice is roughly 1297.61 \( \text{ft}^3 \).

13. \(x^2 + (y - 3)^2 = 16\)
   This is the equation of a circle with radius \(r = \sqrt{16} = 4\) and center at \((0, 3)\). Starting at the center we can obtain some points on the graph by moving 4 units up, down, left, and right. The corresponding points are \((0, 7)\), \((0, -1)\), \((-4, 3)\), and \((4, 3)\), respectively.

\[ 3x^2 + 4y = 12 \] different

16. First we find the slope:
\[ m = \frac{8 - 4}{6 - (-2)} = \frac{4}{8} = \frac{1}{2} \]

Next we use the slope and the given point \((6, 8)\) in the point-slope form of the equation of a line:
\[ y - y_1 = m(x - x_1) \]
\[ y - 8 = \frac{1}{2}(x - 6) \]
\[ y - 8 = \frac{1}{2}x - 3 \]
\[ y = \frac{1}{2}x + 5 \]

Project III

1. Driveway

   2 miles

   Possible route 1

   5 miles

   Cable box

   Highway

   Possible route 2

2. House

   $140/mile

   \( L = \sqrt{4 + (5 - x)^2} \)

   \( x \)

   \( C(x) = 100x + 140L \)

   \( C(x) = 100x + 140\sqrt{4 + (5 - x)^2} \)

   \[ \begin{array}{c|c}
   x & C(x) \\
   \hline
   0 & 100(0) + 140\sqrt{4 + 25} = 753.92 \\
   1 & 100(1) + 140\sqrt{4 + 16} = 726.10 \\
   2 & 100(2) + 140\sqrt{4 + 9} = 704.78 \\
   3 & 100(3) + 140\sqrt{4 + 4} = 695.98 \\
   4 & 100(4) + 140\sqrt{4 + 1} = 713.05 \\
   5 & 100(5) + 140\sqrt{4 + 0} = 780.00 \\
   \end{array} \]

   The choice where the cable goes 3 miles down the road then cutting up to the house seems to yield the lowest cost.

4. Since all of the costs are less than $800, there would be a profit made with any of the plans.

   \( C(x) \text{ dollars} \)

   Using the MINIMUM function on a graphing calculator, the minimum occurs at \( x = 2.96 \).

   \( C(x) \text{ dollars} \)

6. \( C(4.5) = 100(4.5) + 140\sqrt{4 + (5 - 4.5)^2} = 738.62 \)

   The cost for the Steven’s cable would be $738.62.

7. \( 5000(738.62) = 3,693,100 \text{ State legislated} \)

   \( 5000(695.96) = 3,479,800 \text{ cheapest cost} \)

   It will cost the company $213,300 more.

Project IV

1. \( A = \pi r^2 \)

2. \( r = 2.2t \)

3. \( r = 2.2(2) = 4.4 \text{ ft} \)

   \( r = 2.2(2.5) = 5.5 \text{ ft} \)

4. \( A = \pi(4.4)^2 = 60.82 \text{ ft}^2 \)

   \( A = \pi(5.5)^2 = 95.03 \text{ ft}^2 \)

5. \( A = \pi(2.2t)^2 = 4.84\pi t^2 \)

6. \( A = 4.84\pi(2)^2 = 60.82 \text{ ft}^2 \)

   \( A = 4.84\pi(2.5)^2 = 95.03 \text{ ft}^2 \)

7. \( A(2.5) - A(2) = \frac{95.03 - 60.82}{2.5 - 2} = 68.42 \text{ ft/hr} \)

8. \( A(3.5) - A(3) = \frac{186.27 - 136.85}{3.5 - 3} = 98.84 \text{ ft/hr} \)

9. The average rate of change is increasing.

10. \( 150 \text{ yds} = 450 \text{ ft} \)

   \( r = 2.2t \)

   \( t = \frac{450}{2.2} = 204.5 \text{ hours} \)

11. \( 6 \text{ miles} = 31680 \text{ ft} \)

   Therefore, we need a radius of 15,840 ft.

   \( t = \frac{15,840}{2.2} = 7200 \text{ hours} \)
